

Systems manager:

It helps to install application in multiple instances at a time

- [] Lunch 2 instance (amazon Linux)

- [] create IAM roles

 - [] in permissions select systems manager full access

Attach those roles to instances

- [] Go to EC2

- [] select instances and right click

- [] in security select modify IAM role and add created role

- [] Go to system manager

- [] in node management

- [] select Run command

- [] Run command

- [] in command document

- [] search and select AWS-RunShell

- [] in command parameters

 - [] sudo yum update -y

 - [] sudo yum -y install httpd

 - [] sudo systemctl start httpd

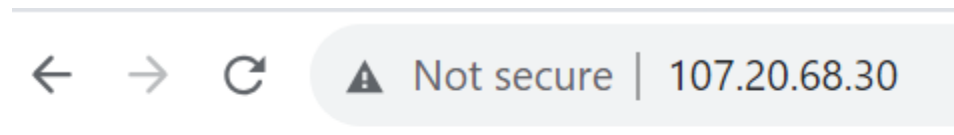

- [] in target selection

[] choose instance manually

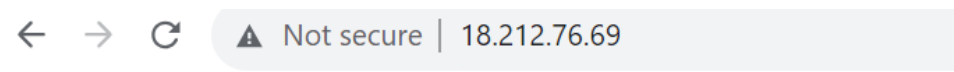

[] if we want select S3 and SNS we can select that option also

[] RUN

[] after getting success, we can view the output copy the public IP of instance paste it in chrome

It works!

It works!
